CSE0001 - DIGITAL LITERACY

24TH MARCH 2026

• Introduction

Digital literacy is the ability to find, evaluate and communicate information using digital technologies which is done safely, effectively, and responsibly. The OBJECTIVE is to educate people about digital literacy and to spread awareness on digital communication, online safety and cybersecurity. In this the usage of basic tools such as CANVA, GOOGLE DOCS, GIT HUB, LINKEDIN and many more is taught apart from this, it teaches us how we can protect us from cybercrime, theft, ransomware, payment theft and much more. The main aim of this case study is- A digitally aware individual, capable of educating others and responsible in using online platforms no of words.

• Task 1

The infographic in task-1-presentation is made using CANVA INFOGRAPHIC TEMPLATE. Starting with Bold title representing the title that is DIGITAL LITERACY, followed by a small definition and then the tools used which is then followed by some safe internet practices. The design shows how digital literacy is not just about using technology, but also about understanding, creating, and staying safe online. I have used soft colors, appealing texts and highlighters to make it easy to read. One thing that I found interesting is that how canvas provides built in templates and texts which made every process fast. Moreover, the difficult part was choosing right color combinations and aligning all the texts correctly.

- ## Task 2

For task 2, I made my profile on LinkedIn, GitHub and Kaggle. Each of these websites serves different purposes for a student. GITHUB is used for managing codes and collaborating projects. LinkedIn is a professional platform where I can connect with my peers, professionals and show my achievements. Kaggle is focused on learning, where users can practice problems, participate in competitions, and learn from datasets. For the next four years, I plan to use GitHub to upload my projects, manage my codes and improve my development skills. On LinkedIn, I will regularly update my profile, share achievements and posts, and build a social and professional network. On Kaggle, I have planned to enhance my problem-solving skills by participating in competitions and working on real-world problems. Together, these platforms will help me grow academically.

- ## Task 3

For this task, I used HackerRank along with google docs. On HackerRank, I created my account and completed my profile details and then as instructed, I solved a beginner 'solve me first' challenge and earned problem solving badge. It helped me improve my logical and problem solving skills. Doing this regularly will help me strengthen my coding ability. In part B, I used Google docs to make a quiz on digital literacy. It had 4 multiple choice questions and 1 short answer type and then I shared the link with my peers. I recorded their response in the response sheet, where I could easily view data. The tools helped me by improving my technical skills. HackerRank will enhance my programming knowledge while google workspace will help me in projects. It made my work more efficient in completing academic tasks.

• Task 4

A situation where digital communication caused problem could be when a group has to prepare on a project and the only way to communicate is through a WhatsApp group. Here, one member shares all the information, but the message is unclear as it lacks details about deadlines and responsibilities. Due to lack of understanding some members took it wrongly and misunderstood it while some did not even see the message because of too many notifications and messages in the group. As a result the project was submitted late which affected everyone's marks. This could have been avoided by the person messaging if it had been more structured and clear. The message with proper instruction about who is going to do what job, about the deadlines and assignment roles could have been more easily understood by everyone. Using a shared document like google docs for updates would also help. Additionally, asking for reviews from all the members ensures that everyone understood the task properly.

• Task 5 Part A

The crime is UPI or online payment fraud in which the hackers by using social engineering techniques trick users into transferring money through digital payments apps like google pay and phonepe. They usually first call the victim via a phone call or an sms often pretending to a bank officer or a trusted authority. Then they create a sense of urgency claiming there is an issue with their account with need urgent refund or like it is providing a reward. By sending a fake link for payment and as soon as they receive the OTP from the victim, the money is instantly transferred to the fraud account.

These scams mostly target people who are not much educated about online payment frauds. The consequences can be serious such as stress and financial loss and the trust on online payment will vanish.

To prevent such frauds we should never share our UPI PIN or OTP. We should never verify unknown requests or click on suspicious links. Awareness is very important in case of cybercrimes.

• Task 5 Part B

While researching about the topic what surprised me the most was how people could easily fall into the trap of the fraudsters. Then the thought stuck me that I am seeing all this with my point of view and I know what should I do when such cases happens and that is to verify but about the rest people new to this. I realized that many attacks do not rely on advanced technology but instead exploit human trust and lack of awareness.

One habit I will personally change is being cautious while doing online payments. The steps are to carefully verify UPI requests and never share OTP. Always verify before doing anything. This awareness will help me stay safe from frauds.

• Conclusion

Overall, firstly the project helped me have a better knowledge of tools in Canvas. With its help, I made an infographic image on digital literacy. I learned how to create and manage professional profiles on LinkedIn and GitHub which is very useful for me in long term as an engineering student. Then I also made my profile on Kaggle and then on HackerRank, which improved my coding as well as problem solving skills.

Moreover, I learnt effective digital communication using tools like google docs and google sheets. I understood how to make google forms and quizzes which had multiple choice questions as well as short answer type questions.

Additionally, learning about cybercrimes such as in UPI payments made me more aware of online payment risks and how I can overcome such difficulties.

Overall, this project enhanced my technical, communication and awareness skills.
